## AN ARRANGEMENT AND A METHOD IN A TELEPHONY SYSTEM

### TECHNICAL FIELD OF THE INVENTION

The present invention relates to an arrangement and a method in a telephony system in which a stationary telephony terminal is connected to a mobile radio  
5 telephony network via a mobile radio telephone, and to the stationary telephony terminal.

### DESCRIPTION OF RELATED ART

*al*  
A person communicating via a telecommunications network often uses a conventional stationary deskphone, which is convenient to use as it has a big keypad  
10 and a big display. The person can use stationary deskphones when moving between different locations, but then subscriptions, rights, identities etc belonging to other persons are utilized. Instead, when moving the person can use a mobile telephone, which is small and is easy to carry around. The mobile telephone on the other hand has a small keypad that can be a bit difficult to use and has a tiny display that can be  
15 hard to view. The sound quality and the volume are not always excellent for a mobile telephone but are nearly always so for a deskphone. The handset for the deskphone is often regarded as more convenient to hold than the small mobile telephone. This leads to a situation where people have both a mobile telephone to carry around and a stationary deskphone in the office. The person has separate accesses although one  
20 would have been enough and the person also must have multiple sets of user data in the telephony system. Multiple directory numbers can be confusing for other persons. Also, the deskphone still requires the person to be tied to a particular telephone line, and if the person moves permanently the user data have to be changed.

The European patent application EP 0 930 766 A2 discloses a system for radio  
25 communication between a wireless LAN and a PBX. The wireless LAN has remote devices, which have radio access to the PBX and can use its different features. In an
